

## Note 24. Long-Term Fiscal Projections

The SLTFP is prepared pursuant to SFFAS No. 36, *Comprehensive Long-Term Projections for the U.S. Government*. The financial statements, Note 24, and unaudited RSI provide information to aid readers of the *Financial Report* in assessing whether current policies for federal spending and taxation can be sustained and the extent to which the cost of public services received by current taxpayers will be shifted to future taxpayers. This assessment requires prospective information about receipts and spending, the resulting debt, and how these amounts relate to the size of the economy. A sustainable policy is defined in this report as one where the ratio of federal debt held by the public to GDP (the debt-to-GDP ratio) is ultimately stable or declining. The *Financial Report* does not address the sustainability of state and local government fiscal policy.

The projections and analysis presented here are extrapolations based on an array of assumptions described in detail below. A fundamental assumption is that current federal policy will not change. This assumption is made so as to inform the question of whether current fiscal policy is sustainable and, if it is not sustainable, the magnitude of needed reforms to make fiscal policy sustainable. The projections are therefore neither forecasts nor predictions. If policy changes are implemented, perhaps in response to projections like those presented here, then actual financial outcomes will be different than those projected. The methods and assumptions underlying the projections are subject to continuing refinement.

The projections focus on future cash flows, and do not reflect either the accrual basis or the modified-cash basis of accounting. These cash-based projections reflect receipts or spending at the time cash is received or when a payment is made by the government. In contrast, accrual-based projections would reflect amounts in the time period in which income is earned or when an expense or obligation is incurred. The cash basis accounting underlying the long-term fiscal projections is consistent with methods used to prepare the SOSI and the generally cash-based federal budget.

The SLTFP displays the PV of 75-year projections for various categories of the federal government's receipts and non-interest spending.<sup>6</sup> The projections for FYs 2024 and 2023 are expressed in PV dollars and as a percent of the PV of GDP<sup>7</sup> as of September 30, 2024 and September 30, 2023, respectively. The PV of a future amount, for example \$1.0 billion in October 2099, is the amount of money that if invested on September 30, 2024 in an account earning the government borrowing rate would have a value of \$1.0 billion in October 2099.<sup>8</sup>

The PV of a receipt or spending category over 75 years is the sum of the annual PV amounts. When expressing a receipt or spending category over 75 years as a percent of GDP, the PV dollar amount is divided by the PV of GDP over 75 years. Measuring receipts and spending as a percent of GDP is a useful indicator of the economy's capacity to sustain federal government programs.

### Fiscal Projections

Receipt categories in the long-term fiscal projections include individual and corporation income taxes, Social Security and Medicare payroll taxes, and a residual category of "other receipts." Non-interest spending categories include discretionary spending that is funded through annual appropriations, such as spending for national security, and mandatory (entitlement) spending that is generally funded with permanent or multi-year appropriations, such as spending for Social Security and Medicare. This year's long-term fiscal projections for Social Security and Medicare are based on the same economic and demographic assumptions that underlie the 2024 SOSI, which is as of January 1, 2024. Accordingly, the economic and demographic assumptions used in the long-term fiscal projections of Social Security and Medicare are not adjusted for the more current near-term economic information after the time assumptions were set in December 2023. Projections for the other categories of receipts and spending are consistent with the economic and demographic assumptions in the Trustees Reports and include updates for actual budget results for FY 2024 or budgetary estimates from the President's FY 2025 Budget.<sup>9</sup>

The projections assume the continuance of current policy, which builds off current law, but can be different than current law in cases where lawmakers have in the past periodically changed the law in a consistent way. The specific assumptions that depart from current law and are used for the current policy basis of these projections are explained below.

<sup>6</sup> For the purposes of this analysis, spending is defined in terms of outlays. In the context of federal budgeting, spending can either refer to budget authority – the authority to commit the government to make a payment; to obligations – binding agreements that will result in payments, either immediately or in the future; or to outlays – actual payments made.

<sup>7</sup> GDP is a standard measure of the overall size of the economy and represents the total market value of all final goods and services produced domestically during a given period of time. The components of GDP are: private sector consumption and investment, government consumption and investment, and net exports (exports less imports). Equivalently, GDP is a measure of the gross income generated from domestic production over the same time period.

<sup>8</sup> PVs recognize that a dollar paid or collected in the future is worth less than a dollar today because a dollar today could be invested and earn interest. To calculate a PV, future amounts are thus reduced using an assumed interest rate, and those reduced amounts are summed.

<sup>9</sup> Social Security and Medicare Trustees Reports can be found at <https://www.ssa.gov/OACT/TR/>.

The projections shown in the SLTFP are made over a 75-year time frame, consistent with the time frame featured in the Social Security and Medicare Trustees Reports. However, these projections are for fiscal years starting on October 1, whereas the Trustees Reports feature calendar-year projections. Using fiscal years allows the projections to start from the actual budget results from FYs 2024 and 2023.

<b>Changes in Long-Term Fiscal Projections</b>		
PV of 75-year projections	Trillions of \$	Percent of 75-Year PV of GDP
<b>Receipts less non-interest spending as of September 30, 2023</b>	(73.2)	(3.8) %
<b>Components of change:</b>		
Change in reporting period	(1.4)	- %
Change in model technical assumptions	(0.6)	- %
Change due to economic and demographic assumptions	4.8	0.3 %
Change due to program-specific actuarial assumptions	0.3	- %
Change due to updated budget data	(2.5)	(0.1) %
Total	0.5	0.2 %
<b>Receipts less non-interest spending as of September 30, 2024</b>	<b>(72.7)</b>	<b>(3.6) %</b>

Note: Totals may not equal the sum of components due to rounding. The 75-year PV of GDP is updated with the change in reporting period and change in economic and demographic assumptions.

This year's estimate of the 75-year PV imbalance of receipts less non-interest spending is 3.6 percent of the current 75-year PV of GDP, compared with 3.8 percent projected in last year's *Financial Report*.<sup>10</sup> The above table reports the effects of various factors on the updated projections.

- The largest factor affecting the projections is the update of economic and demographic assumptions that decreases the fiscal imbalance by 0.3 percentage points (\$4.8 trillion). Contributing to this improvement in the imbalance are higher wages that increase receipts and higher GDP levels that reduce spending as a percentage of GDP. The 75-year PV of GDP for this year's projections is \$2,002.6 trillion, greater than last year's \$1,919.1 trillion.
- The second factor affecting the projections—increasing the imbalance as a share of the 75-year PV of GDP by 0.1 percentage points (\$2.5 trillion)—is the update for actual budget results for FY 2024 and baseline estimates published in the FY 2025 President's Budget. This deterioration in the fiscal position is largely a result of a higher 75-year PV of discretionary spending on non-defense programs due in part to adjustments to accord with FY 2024 appropriations. In addition, actual budget results for FY 2024 contribute to an increase in the fiscal imbalance by raising the 75-year PV of spending for Medicaid and mandatory spending on programs other than Social Security and Medicare. Partially offsetting those changes is a higher 75-year PV of individual income tax receipts, which represent a larger share of wages and salaries relative to the previous year's projections.
- The third largest factor affecting the projected imbalance is the change in reporting period—the effect of shifting calculations from 2024 through 2098 to 2025 through 2099. The update increases the imbalance of the 75-year PV of receipts less non-interest spending by \$1.4 trillion, which has a negligible effect as a share of the 75-year PV of GDP.
- The fourth largest factor affecting the projections is a technical update to the model's assumptions for growth in enrollees for health insurance marketplace subsidies. The technical update increases the 75-year fiscal imbalance by \$0.6 trillion and has a trivial impact on the projections as a share of the 75-year PV of GDP.
- The smallest factor affecting the projections is the effect of new Social Security, Medicare, and Medicaid program-specific actuarial assumptions, which decrease the fiscal imbalance by \$0.3 trillion and negligibly affect the imbalance as of the 75-year PV of GDP.<sup>11</sup>

<sup>10</sup> The fiscal imbalances reported in the long-term fiscal projections do not include the initial level of publicly held debt, which was \$28.2 trillion in 2024 and \$26.2 trillion in 2023, and, therefore, they do not by themselves answer the question of how large fiscal reforms must be to make fiscal policy sustainable. See "Sustainability and the Fiscal Gap" for additional discussion. More information on the projections in last year's *Financial Report* can be found in Note 24 to the financial statements here: <https://fiscal.treasury.gov/reports-statements/#>.

<sup>11</sup> For more information on Social Security and Medicare actuarial estimates, refer to Note 25—Social Insurance.

The net effect of the changes in the table above, equal to the penultimate row in the SLTFP, shows that this year's estimate of the overall 75-year PV of receipts less non-interest spending is negative 3.6 percent of the 75-year PV of GDP (negative \$72.7 trillion, as compared to a GDP of \$2,002.6 trillion). This imbalance can be broken down by funding source. Spending projections exceeded receipts by 2.2 percent of GDP (about \$43.6 trillion) among programs funded by the government's general revenues, and there is an imbalance of 1.5 percent of GDP (about \$29.0 trillion)<sup>12</sup> for the combination of Social Security (OASDI) and Medicare Part A, which under current law are funded with payroll taxes and not in any material respect with general revenues.<sup>13,14</sup> By comparison, the FY 2023 projections showed that programs funded by the government's general revenues had an excess of spending over receipts of 2.2 percent of GDP (\$42.2 trillion) while the payroll tax-funded programs had an imbalance of spending over receipts of 1.6 percent of GDP (\$30.9 trillion).

## Sustainability and the Fiscal Gap

This *Financial Report* presents data, including debt, as a percent of GDP to help readers assess whether current fiscal policy is sustainable. The debt-to-GDP ratio was approximately 98 percent at the end of FY 2024. As discussed further in the unaudited RSI, the projections based on this *Financial Report's* assumptions indicate that current policy is not sustainable. If current policy is left unchanged, the projections show the debt-to-GDP ratio will be approximately 100 percent in 2025, rise to 200 percent by 2049 and reach 535 percent in 2099. Moreover, if the trends that underlie the 75-year projections were to continue, the debt-to-GDP ratio would continue to rise beyond the 75-year window.

The fiscal gap measures how much the primary surplus (receipts less non-interest spending) must increase in order for fiscal policy to achieve a target debt-to-GDP ratio in a particular future year. In these projections, the fiscal gap is estimated over a 75-year period, from 2025 to 2099, and the target debt-to-GDP ratio is equal to the ratio at the beginning of the projection period, in this case the estimated debt-to-GDP ratio at the end of FY 2024. The target year is the last year of the 75-year period (2099).

The 75-year fiscal gap under current policy is estimated at 4.3 percent of GDP, which is 22.5 percent of the 75-year PV of projected receipts and 19.0 percent of the 75-year PV of non-interest spending. This estimate of the fiscal gap is 0.1 percentage points lower than estimated in 2023 (4.5 percent of GDP).

The projections show that projected primary deficits average 3.6 percent of GDP over the next 75 years under current policy. If policies were put in place that would close the fiscal gap, the average primary surplus over the next 75 years would be 0.7 percent of GDP, 4.3 percentage points higher than the projected PV of receipts less non-interest spending shown in the SLTFP. In these projections, closing the fiscal gap requires running a positive level of primary surplus, rather than simply eliminating the primary deficit. The primary reason is that the projections assume future interest rates will exceed the growth rate of GDP. Achieving primary balance (that is, running a primary surplus of zero) implies that the debt held by the public grows each year by the amount of interest spending, which under these assumptions would result in debt growing faster than GDP.

<sup>12</sup> The 75-year PV imbalance for Social Security and Medicare Part A of \$29.0 trillion is comprised of several line items from the SLTFP – Social Security outlays net of Social Security payroll taxes (\$34.2 trillion) and Medicare Part A outlays net of Medicare payroll taxes (\$8.7 trillion) – as well as subcomponents of these programs not presented separately in the statement. These subcomponents include Social Security and Medicare Part A administrative costs that are classified as non-defense discretionary spending (\$0.7 trillion) and Social Security and Medicare Part A income other than payroll taxes: taxation of benefits (-\$12.5 trillion), federal employer share (-\$2.0 trillion), and other income (-\$0.1 trillion).

<sup>13</sup> Social Security and Medicare Part A expenditures can exceed payroll tax revenues in any given year to the extent that there are sufficient balances in the respective trust funds; these balances derive from past excesses of payroll tax revenues over expenditures and interest earned on those balances and represent the amount the General Fund owes the respective trust fund programs. When spending does exceed payroll tax revenues, as has occurred each year since 2008 for Medicare Part A and 2010 for Social Security, the excess spending is financed first with interest due from the General Fund and secondly with a drawdown of the trust fund balance. Once the reserves in the trust funds are depleted, under current law benefits for Social Security and Medicare Part A can be paid only to the extent there are resources from dedicated income sources. In order for the long-term fiscal projections to reflect the full size of these programs' commitments to pay future benefits, the projections assume that all scheduled benefits will be financed with borrowing to the extent necessary after the trust funds are depleted.

<sup>14</sup> The fiscal imbalances reported in the long-term fiscal projections are limited to future outlays and receipts. They do not include the initial level of publicly-held debt, \$28.2 trillion in 2024 and \$26.2 trillion in 2023, and therefore they do not by themselves answer the question of how large fiscal reforms must be to make fiscal policy sustainable, or how those reforms divide between reforms to Social Security and Medicare Part A and to other programs. Other things equal, past cash flows (primarily surpluses) for Social Security and Medicare Part A reduced federal debt at the end of 2024 by \$3.0 trillion (the trust fund balances at that time); the contribution of other programs to federal debt at the end of 2024 was therefore \$31.2 trillion. Similarly, because the \$29.0 trillion imbalance between outlays and receipts over the next 75 years for Social Security and Medicare Part A does not take account of the Social Security and Medicare Part A trust fund balances, it overstates the magnitude of reforms necessary to make Social Security and Medicare Part A solvent over 75 years by \$3.0 trillion. The \$3.0 trillion combined Social Security and Medicare Part A trust fund balance represents a claim on future general revenues.

## Assumptions Used and Relationship to Other Financial Statements

A fundamental assumption underlying the projections is that current federal policy (defined below) does not change. The projections are therefore neither forecasts nor predictions, and do not consider large infrequent events such as natural disasters, military engagements, or economic crises. By definition, they do not build in future changes to policy. If policy changes are enacted, perhaps in response to projections like those presented here, then actual fiscal outcomes will be different than those projected.

Even if policy does not change, actual spending and receipts could differ materially from those projected here. Long-range projections are inherently uncertain and are necessarily based on simplifying assumptions. For example, one key simplifying assumption is that interest rates paid on debt held by the public do not vary with the amount of debt outstanding. To the contrary, it is likely that future interest rates would increase if the debt-to-GDP ratio rises as shown in these projections. To help illustrate this uncertainty, projections that assume higher and lower interest rates are presented in the “Alternative Scenarios” discussion in the unaudited RSI section of this *Financial Report*.

As is true for prior long-term fiscal projections for the *Financial Report*, the assumptions for GDP, interest rates, and other economic and demographic variables underlying this year’s projections are the same assumptions that underlie the most recent Social Security and Medicare Trustees Report projections, adjusted for historical revisions that occur annually. These assumptions differ from those in the President’s Budget in several key ways.<sup>15</sup> For example, they extend for 75 years, rather than 25 years. Additionally, they assume extension of current policy whereas the economic assumptions in the President’s Budget assume full implementation of policy proposals reflected in the Budget. The use of discount factors consistent with the Social Security Trustees rate allows for consistent PV calculations over 75 years between the SLTFP and the SOSI.

The following bullets summarize the key assumptions used for the categories of receipts and spending presented in the SLTFP and the disclosures:

- **Social Security:** The projections of Social Security spending and Social Security payroll taxes are based on future spending and payroll taxes projected in the 2024 Social Security Trustees Report, adjusted for presentational differences, and converted to a fiscal year basis. Projected Social Security (OASDI) spending in the SLTFP excludes administrative expenses, which are classified as discretionary spending, and is based on the projected spending in the 2024 Social Security Trustees Report for benefits and for the Railroad Retirement interchange. Projected Social Security payroll taxes are adjusted to exclude the estimated federal employer share, which is classified in the SLTFP and federal budget as an offset to other mandatory spending. More information about the assumptions for Social Security cost growth can be found in Note 25 and the unaudited RSI discussion of Social Insurance.
- **Medicare:** Projected Medicare spending and Medicare Part A payroll taxes are based on Medicare spending and payroll taxes in the Medicare Trustees Report, adjusted for presentational differences and converted to a fiscal year basis. Medicare spending projections in the SLTFP exclude administrative expenses, which are classified as discretionary spending. Medicare Part A, B and D premiums, as well as state contributions to Part D, are subtracted from gross spending in measuring Part A, B and D spending, just as they are subtracted from gross cost to yield net cost in the financial statements.<sup>16</sup> Here, as in the federal budget, premiums are treated as “negative spending” rather than receipts since they represent payment for a service rather than payments obtained through the government’s sovereign power to tax. This is similar to the financial statement treatment of premiums as “earned” revenue as distinct from all other sources of revenue, such as taxes. Projected Medicare Part A payroll taxes are adjusted to exclude the estimated federal employer share, which is classified in the SLTFP and federal budget as an offset to other mandatory spending. More information about the assumptions for Medicare cost growth can be found in Note 25 and the unaudited RSI discussion of Social Insurance. As discussed in Note 25, there is uncertainty about whether the reductions in health care cost growth assumed in the Medicare Trustees Report will be fully achieved. Note 25 illustrates this uncertainty by presenting an illustrative alternative scenario.
- **Medicaid:** The Medicaid spending projections start with NHE projections prepared by CMS’s Office of the Actuary, which were released in June 2024.<sup>17</sup> These projections are based on recent trends in Medicaid spending and the demographic, economic, and health cost growth assumptions in the Medicare Trustees Report. The NHE projections, which end in 2032, are adjusted to accord with the actual Medicaid spending in FY 2024. After 2032, the number of beneficiaries is projected to grow at the same rate as total population. Medicaid cost per beneficiary after 2032 is assumed to transition over a four-year period to growth at the same rate as Medicare benefits per beneficiary. Between 1989 and 2019, the average annual growth rates of spending per beneficiary for Medicaid and

<sup>15</sup> See the FY 2025 President’s Budget, Analytical Perspectives Volume, Chapter 3 “Long-Term Budget Outlook.”

<sup>16</sup> Medicare Part A, B, and D premiums and state contributions to Part D are subtracted from gross Medicare spending to arrive at net Medicare spending displayed in the SLTFP. The total 75-year PV of these subtractions is \$21.6 trillion, or 1.1 percent of GDP.

<sup>17</sup> NHE data are available at <https://www.cms.gov/data-research/statistics-trends-and-reports/national-health-expenditure-data>.

Medicare were within 0.7 percentage point of each other. Projections of Medicaid spending are subject to added uncertainty related to: 1) assumed reductions in health care cost growth discussed above in the context of Medicare; and 2) the projected size of the Medicaid enrolled population, which depends on a variety of factors, including future state actions regarding the PPACA Medicaid expansion.

- **Other Mandatory Spending:** Other mandatory spending includes federal employee retirement, veterans' disability benefits, and means-tested entitlements other than Medicaid. Current mandatory spending components that are judged permanent under current policy are assumed to increase by the rate of growth in nominal GDP starting in 2025, implying that such spending will remain constant as a percent of GDP.<sup>18</sup> Projected spending for health insurance marketplace subsidies starting in 2025 grows with the NHE projected enrollment and per enrollee cost growth for direct purchase private health insurance over the NHE projection period (through 2032 for the FY 2024 projections). After 2032, marketplace subsidies grow with growth in the non-elderly population and with growth in per enrollee health care costs as projected for the Medicare program after that period. As noted above and discussed in Note 25, there is uncertainty about whether the reductions in health care cost growth projected in the Medicare Trustees Report will be fully achieved. Projected marketplace subsidy spending as a percent of GDP remains below the failsafe provision in the PPACA that limits the federal share of spending to 0.504 percent of GDP.
- **Defense and Non-defense Discretionary Spending:** Discretionary spending in 2025 follows the FRA (P.L. 118-5) caps with adjustments to accord with FY 2024 appropriations. Discretionary spending in 2025 also reflects previously enacted appropriations that are exempted from FRA caps. After 2025, discretionary spending grows with GDP. To illustrate sensitivity to different assumptions, PV calculations under alternative discretionary growth scenarios are presented in the unaudited "Alternative Scenarios" RSI section.
- **Receipts (Other than Social Security and Medicare Payroll Taxes):** Individual income taxes are based on the share of salaries and wages in the current law baseline projection in the FY 2025 President's Budget, and the salaries and wages projections in the Social Security 2024 Trustees Report. That baseline accords with the tendency of effective tax rates to increase as growth in income per capita outpaces inflation (also known as "bracket creep") and the expiration dates of individual income and estate and gift tax provisions of TCJA. Individual income taxes increase gradually from 21 percent of wages and salaries in 2025 to 30 percent of wages and salaries in 2099 as real taxable incomes rise over time and an increasing share of total income is taxed in the higher tax brackets. Through the first 10 years of the projections, corporation tax receipts as a percent of GDP reflect the economic and budget assumptions used in developing the FY 2025 President's Budget 10-year baseline budgetary estimates. After this time, corporation tax receipts grow at the same rate as nominal GDP. Other receipts also reflect the FY 2025 President's Budget baseline levels as a share of GDP throughout the budget window, and grow with GDP outside of the budget window. Corporation tax receipts fall from 1.6 percent of GDP in 2025 to 1.3 percent of GDP in 2034, where they stay for the remainder of the projection period. The ratio of other receipts, including excise taxes, estate and gift taxes, customs duties, and miscellaneous receipts, to GDP is estimated to increase from 1.0 percent in 2025 to 1.2 percent by 2030 where it remains through the projection period. To illustrate uncertainty, PV calculations under higher and lower receipts growth scenarios are presented in the "Alternative Scenarios" section.
- **Debt and Interest Spending:** Interest spending is determined by projected interest rates and the level of outstanding debt held by the public. The long-run interest rate assumptions accord with those in the 2024 Social Security Trustees Report.<sup>19</sup> The average interest rate over this year's projection period is 4.5 percent, approximately the same as in the 2023 *Financial Report*. These rates are also used to convert future cash flows to PVs as of the start of FY 2025. Debt at the end of each year is projected by adding that year's deficit and other financing requirements to the debt at the end of the previous year.

## Departures of Current Policy from Current Law

The long-term fiscal projections are made on the basis of current policy, which in some cases is assumed to be different from current law. The notable differences between current policy underlying the projections and current law are: 1) projected spending, receipts, and borrowing levels assume raising or suspending the current statutory limit on federal debt; 2) continued discretionary appropriations are assumed throughout the projection period; 3) scheduled Social Security and Medicare Part A benefit payments are assumed to occur beyond the projected point of trust fund depletion; and 4) many mandatory programs with expiration dates prior to the end of the 75-year projection period are assumed to be reauthorized. As is true in the Medicare Trustees Report and in the SOSI, the projections incorporate programmatic changes already

<sup>18</sup> This assumed growth rate for other mandatory programs after 2025 is slightly higher than the average growth rate in the most recent OMB and Congressional Budget Office 10-year budget baselines.

<sup>19</sup> See related interest rate discussion in Note 25 to the financial statements.

scheduled in law, such as the PPACA productivity adjustment for non-physician Medicare services and the expiration of certain physician bonus payments in 2025.
